The Storyboard GO Journey

What is Storyboard GO

Storyboard GO is a practical tool built for fast, mobile-friendly storyboarding. It's designed to help creators bridge the gap between a quick sketch and a solid pre-visualization, allowing you to work wherever inspiration strikes.

The Face Behind the App

Hello! I'm Witek (you can call me Wit), the creator of Storyboard GO. Professionally, I work as an Animator and Motion Designer, focusing mainly on commercial projects and advertising. I also have a passion for teaching animation, which has given me a deep understanding of the common workflow struggles we all face.

A Personal Project

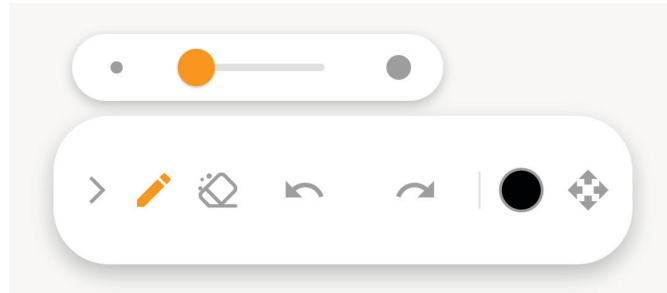

I built this app because I needed a better way to work on the move. I'm not a professional developer – I'm a creator first. My focus is entirely on making sure the app feels right and solves real problems for artists and storyboarders.

Thank you for being a part of this journey!

1. Toolbar

The tool menu is located on the main screen. You can easily **move** the bar by grabbing the arrow icon on the left side of the toolbar, and **minimize** it by single-clicking the same icon. Holding down some tools reveals additional hidden options!

Pencil: Ideal for quick sketches. Hard, symmetrical line without pressure sensitivity.

Brush: Reacts to pressure on supported devices. Great for freehand, natural drawing.

Line: Draws perfectly straight lines from point A to point B.

Arrow: Automatically generates an arrow at the end of a drawn line. Essential for marking camera or character movement.

Thickness Slider: Adjusts the size of the brush or eraser. Click the large dot to thicken, small to thin. You can also precisely drag the slider.

Eraser: Used for removing mistakes. Hold down the eraser icon to switch between the classic drawing eraser and the vector object eraser (e.g., for removing entire arrows).

Color / Eyedropper: Opens the color palette. If you hold down this tool, you activate the eyedropper (color picker) and you can sample any color straight from the scene.

Transform: Used exclusively for rotating, moving, and resizing **imported graphics (assets) and backgrounds**. This tool **does not modify** hand-drawn brush strokes.

Undo / Redo: Use the arrow buttons in the toolbar to undo or redo your last actions. You can also **tap with two fingers** anywhere on the screen to undo, or **tap with three fingers** to redo.

2. Gestures and Navigation

The application was designed with natural touch interaction in mind.

Zoom In / Zoom Out (Two fingers): Pinch or spread two fingers on the canvas to smoothly control the zoom.

Panning (Two fingers): Swipe with two fingers across the screen to move the view.

Rotate scene (Two fingers): Use two fingers (same as zooming) and smoothly rotate the entire scene to a comfortable angle.

Center View: Click the 'Reset view' button to immediately return to the initial layout and scale of the canvas.

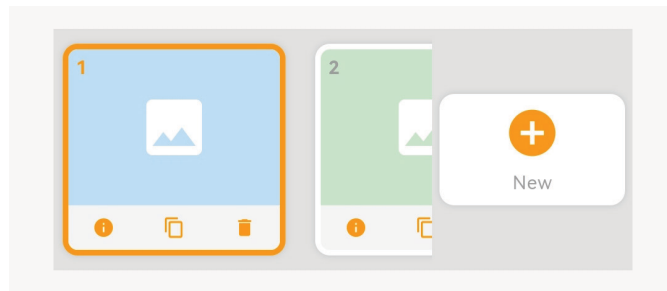

Two-Finger Tap — Undo: Tap with two fingers anywhere on the canvas to undo your last action. You can tap repeatedly to undo multiple actions.

Three-Finger Tap — Redo: Tap with three fingers anywhere on the canvas to redo an undone action.

3. Panel Strip

The panel strip at the top (or side) of the screen displays the chronology of your project's sequence.

New Panel: Click the plus icon to create a new frame.

Preview and Reorder: Drag a panel thumbnail to a different place on the strip to change the chronology of scenes.

Panel Data: On the panel thumbnail you will find a details icon (first from the left). Use it to enter the panel settings. Here you will save the scene number, dialogues, camera action or duration - absolutely crucial data when exporting to PDF or Animatic! From here you can also add a background to the frame.

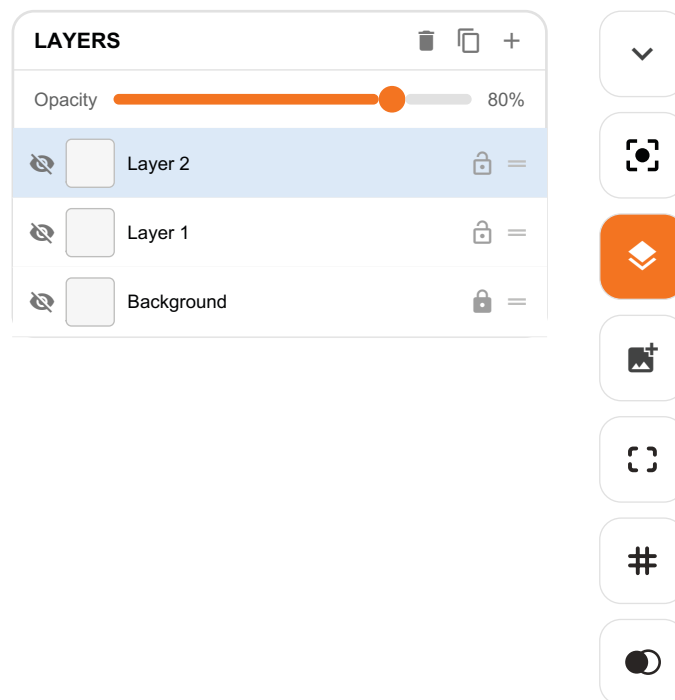

Duplicate / Delete: Next to the panel data icon you will find the copy symbol (duplicate) and the trash icon (delete panel).

Swipe Between Panels: While editing panel data, swipe left or right to quickly jump to the neighboring panel's settings without closing the dialog.

4. Layers and Features

Organize your workflow using a powerful function system.

Center View: Tap the crosshair icon to instantly center the canvas on your screen and reset the zoom level.

Layer Management: Add new layers to separate a character sketch from, say, the final outline or movement arrows.

Delete Layer: Tap the trash can icon in the Layers panel header, or swipe a layer left to delete it.

Copy Layer: Duplicate the currently selected layer by tapping the copy icon in the Layers panel header. A new layer with the same content will be created directly above the original.

Add Layer: Create a new empty layer by tapping the plus icon in the Layers panel header.

Layer Opacity: Adjust the transparency of any layer using the Opacity slider at the top of the Layers panel. Drag it left to make a layer more transparent, or right for full visibility. The percentage value is displayed next to the slider.

Hide Layer: Click the eye icon next to a layer to hide it from view. Click again to make it visible.

Rename Layer: Double click the layer name to rename it.

Lock Layer: Click the padlock icon to lock a layer and prevent accidental strokes or changes.

Import Assets: Load photos or references straight from your device and place them as separate objects on the scene. You frame and move them with the Transform tool. (Remember that a fixed background for the entire frame is added separately in the Panel Data window).

Action Safe / Rule of Thirds: Enable special composition grids. They help you keep elements in "safe" zones for TV formats and frame the image properly.

Onion Skin: Toggles adjacent frames preview. Long press to open Onion Skin options.

5. Saving Your Project

All your files are stored locally on this device.

Manual Save: Click the floppy disk icon in the top-left corner at any time. The app confirms the save with a green notification.

Autosave: The system automatically secures your progress every 2 seconds after each drawing action, when switching panels, changing layer settings, and when leaving the editor.

6. Exporting Projects

Your project can be instantly converted into industry-standard documents.

PDF Storyboard: Generates a classic A4 sheet with tables for each frame. Great for printing for the crew on set! All dialogues, camera and timing notes extracted from 'Panel Data' will land in the appropriate rows.

PNG Sequence: Saves each panel in its original resolution as a separate graphic image straight to your gallery with transparencies (if no background). Ideal for further processing on a PC.

MP4 Animatic: Combines the set 'Durations' from Panel Data into a ready video file! Optionally you can burn a frame counter (Timecode) and composition grids onto it.

SGO Project File: Exports your entire project as a portable .sgo file. Use this format to transfer your work between devices or to share your project with others who also use Storyboard GO. When imported, the project is fully restored — including all panels, layers, drawings, and metadata.

7. Importing SGO Projects

You can transfer projects between devices using the native .sgo file format. Here's how to import a project:

Method 1: The Import Button

In the Projects list, tap the import icon (with a down arrow) located next to the Add Project button. Select your .sgo file from your device, and it will be imported automatically.

Method 2: Directly from a File

Tap any .sgo file in your file manager, email, or sharing dialog. Your device should recognize it and offer to open it with Storyboard GO. The app will launch and import the project.
